The National Comprehensive Cancer Network and McKesson Specialty Health collaborate to advance cancer care by providing oncology quality support system

Collaboration aims to enhance efficiency and quality of cancer care

In today's complex healthcare environment, clinicians face increasing pressure to provide high-quality, cost-effective care consistent with evidence-based standards of medical practice. With this in mind, the National Comprehensive Cancer Network® (NCCN®) and McKesson Specialty Health are collaborating to introduce an enhanced oncology quality support system, allowing oncologists to access the most recent evidence available in the delivery of high-quality cancer care. Accessed through existing practice technologies, the oncology quality support system will be uniquely powered by providing access to the recognized leader in the standards for oncology care, the NCCN Clinical Practice Guidelines in Oncology (NCCN Guidelines®).

The goal of the oncology quality support system and its reporting tools is to enhance best practices nationally for optimal patient care. The system will give oncologists the ability to access evidence-based recommendations efficiently within their practice workflow and smoothly integrate across different electronic health records (EHRs). Additionally, it will provide a tool to measure quality and adherence to best practices to support value-based reimbursement that major employers request from NCCN.

Phase I of the system will be available to oncologists in the coming months. Further, the organizations are working to develop additional applications and tools to measure quality and deliver value and quality-based care as market needs evolve. For more information, please contact McKesson Specialty Health at msh.providers@mckesson.com.
